A Giant Menace

Though the subject of the Asian gi-
ant hornet (Vespa velutina, known as
a Japanese wasp in Europe) was cov-
ered in my June 17th column, I recog-
nized there are still many areas of con-
tinue to get around.

One problem is that soil steaming on farms is an emerg-
ing technology that is being utilized to manage disease, weeds, and pests in high tunnels. There is also an ap-
plification for steam in sanitizing greenhouse equip-
ment systems.

any more Asian giant hornets still in the county. Washington State Department of Agriculture will continue setting traps at least through November. Though the state of Washington is on the other side of the continent, let us not forget these insects originally found their way from Asia into Canada and from Canada into the United States. Distance doesn’t seem to be a problem. They do get around!

Phyllis Shemchuk has gardened in Athol, MA for more than 30 years.

The eradication of the pests took

The recent discovery of the nest in question wasn’t by accident. Officials had previously trapped three of the gi-
ant hornets. With the help of glue and dental floss, they attached tiny radio trackers to the bees. One of these bees led officials to the nest. The hornets usually build their nests in the ground, but this one was about eight feet up in a cavity of a tree located in an area of private property. Dozens of the hornets were seen buzzing in and out of the tree. Up to that time, just over 20 live
